

INTERNATIONAL LEOPARD DAY

The most endangered leopard subspecies is the Amur leopard, which is native to the Russian Far East and parts of China. The population of Amur leopards declined significantly over the past few decades due to habitat loss, poaching, and human-wildlife conflict. Although their numbers are increasing, the latest estimates suggest there are fewer than 100 Amur leopards left in the wild, making them one of the most critically endangered big cats in the world.

You can protect this elusive big cat by donating to our conservation projects today.
